Agenda

VPN vs. Zero Trust

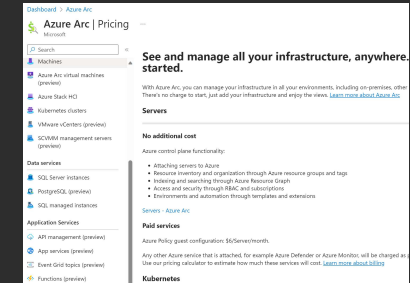

Entra Suite
in a Nutshell

Global Secure Access

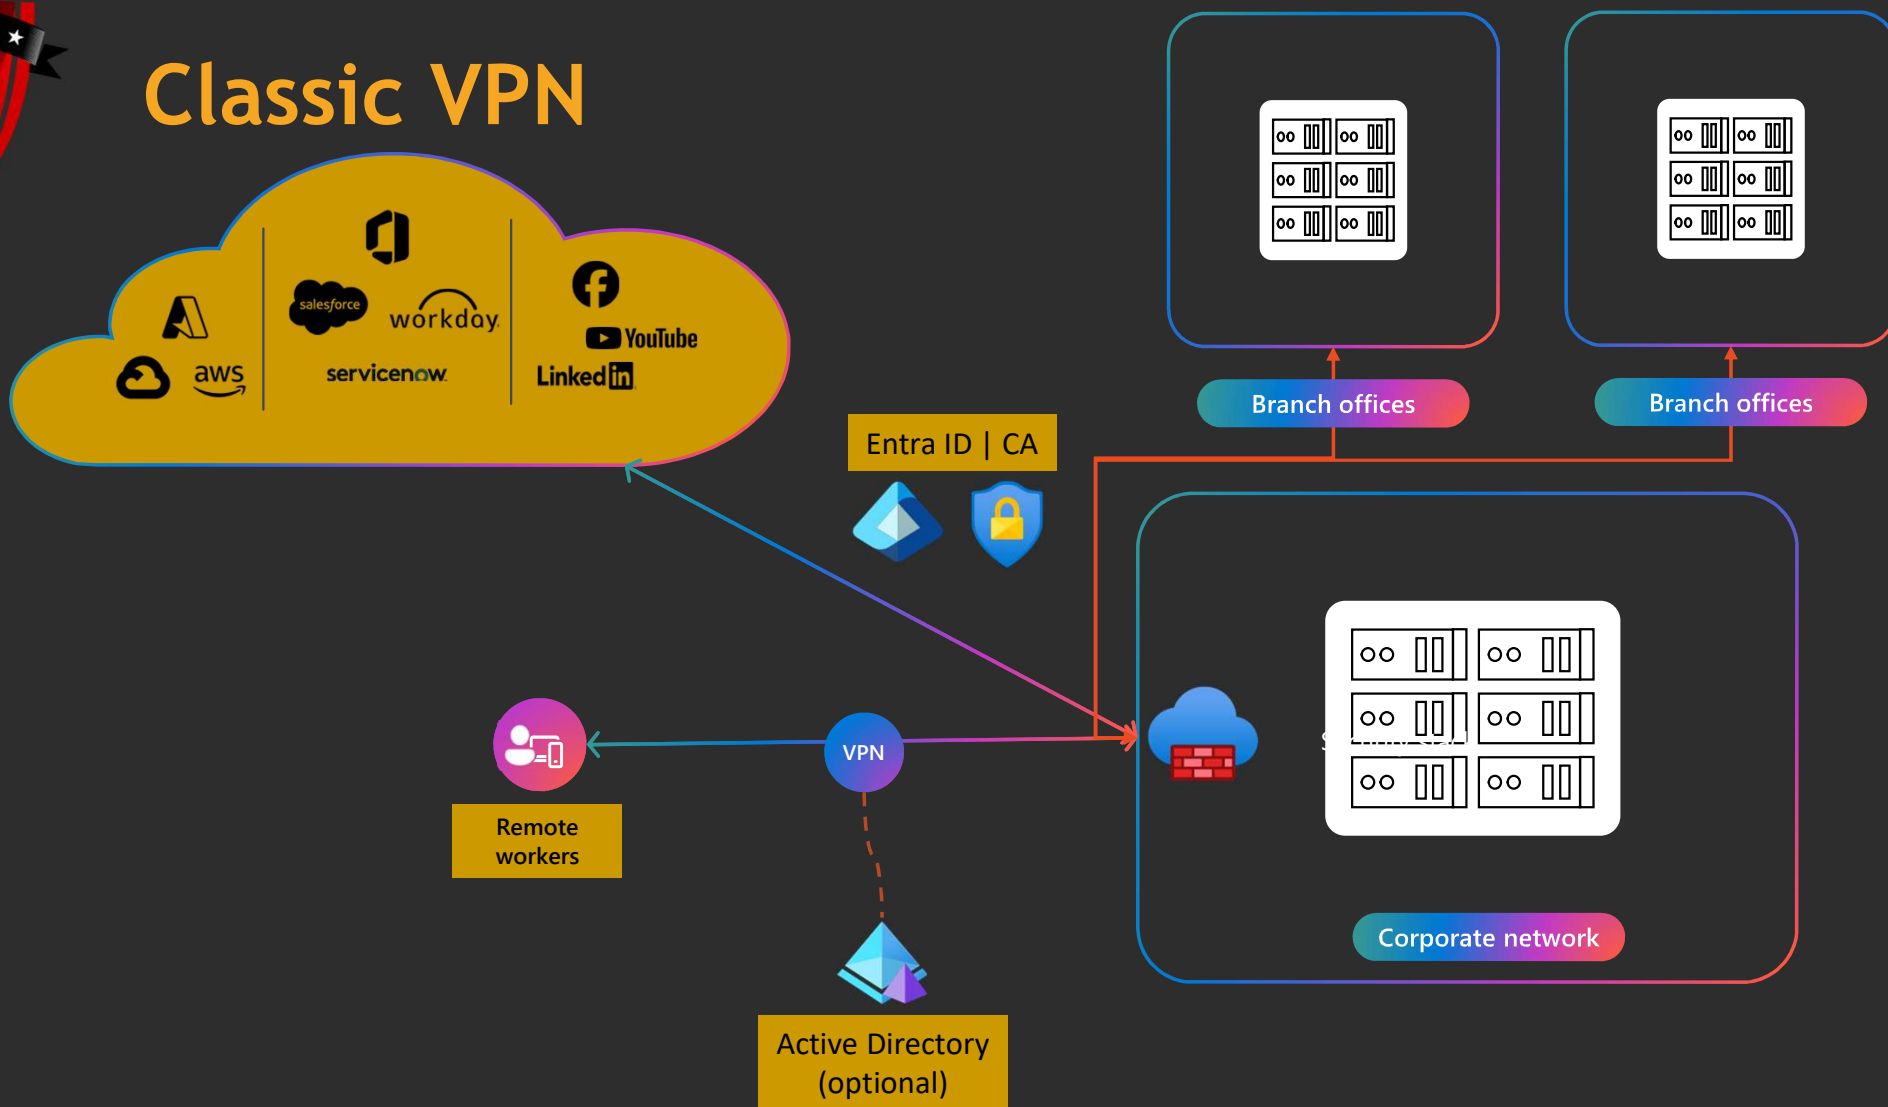

Dive into Entra
Private Access

Migration Path
and Licensing

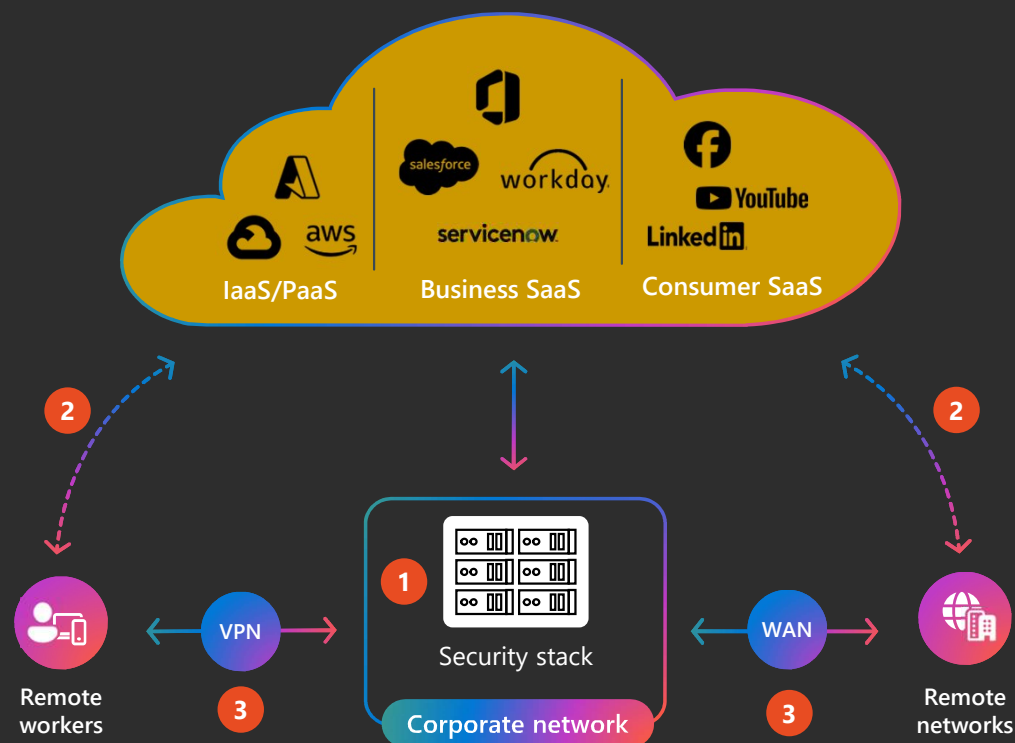

Classic VPN

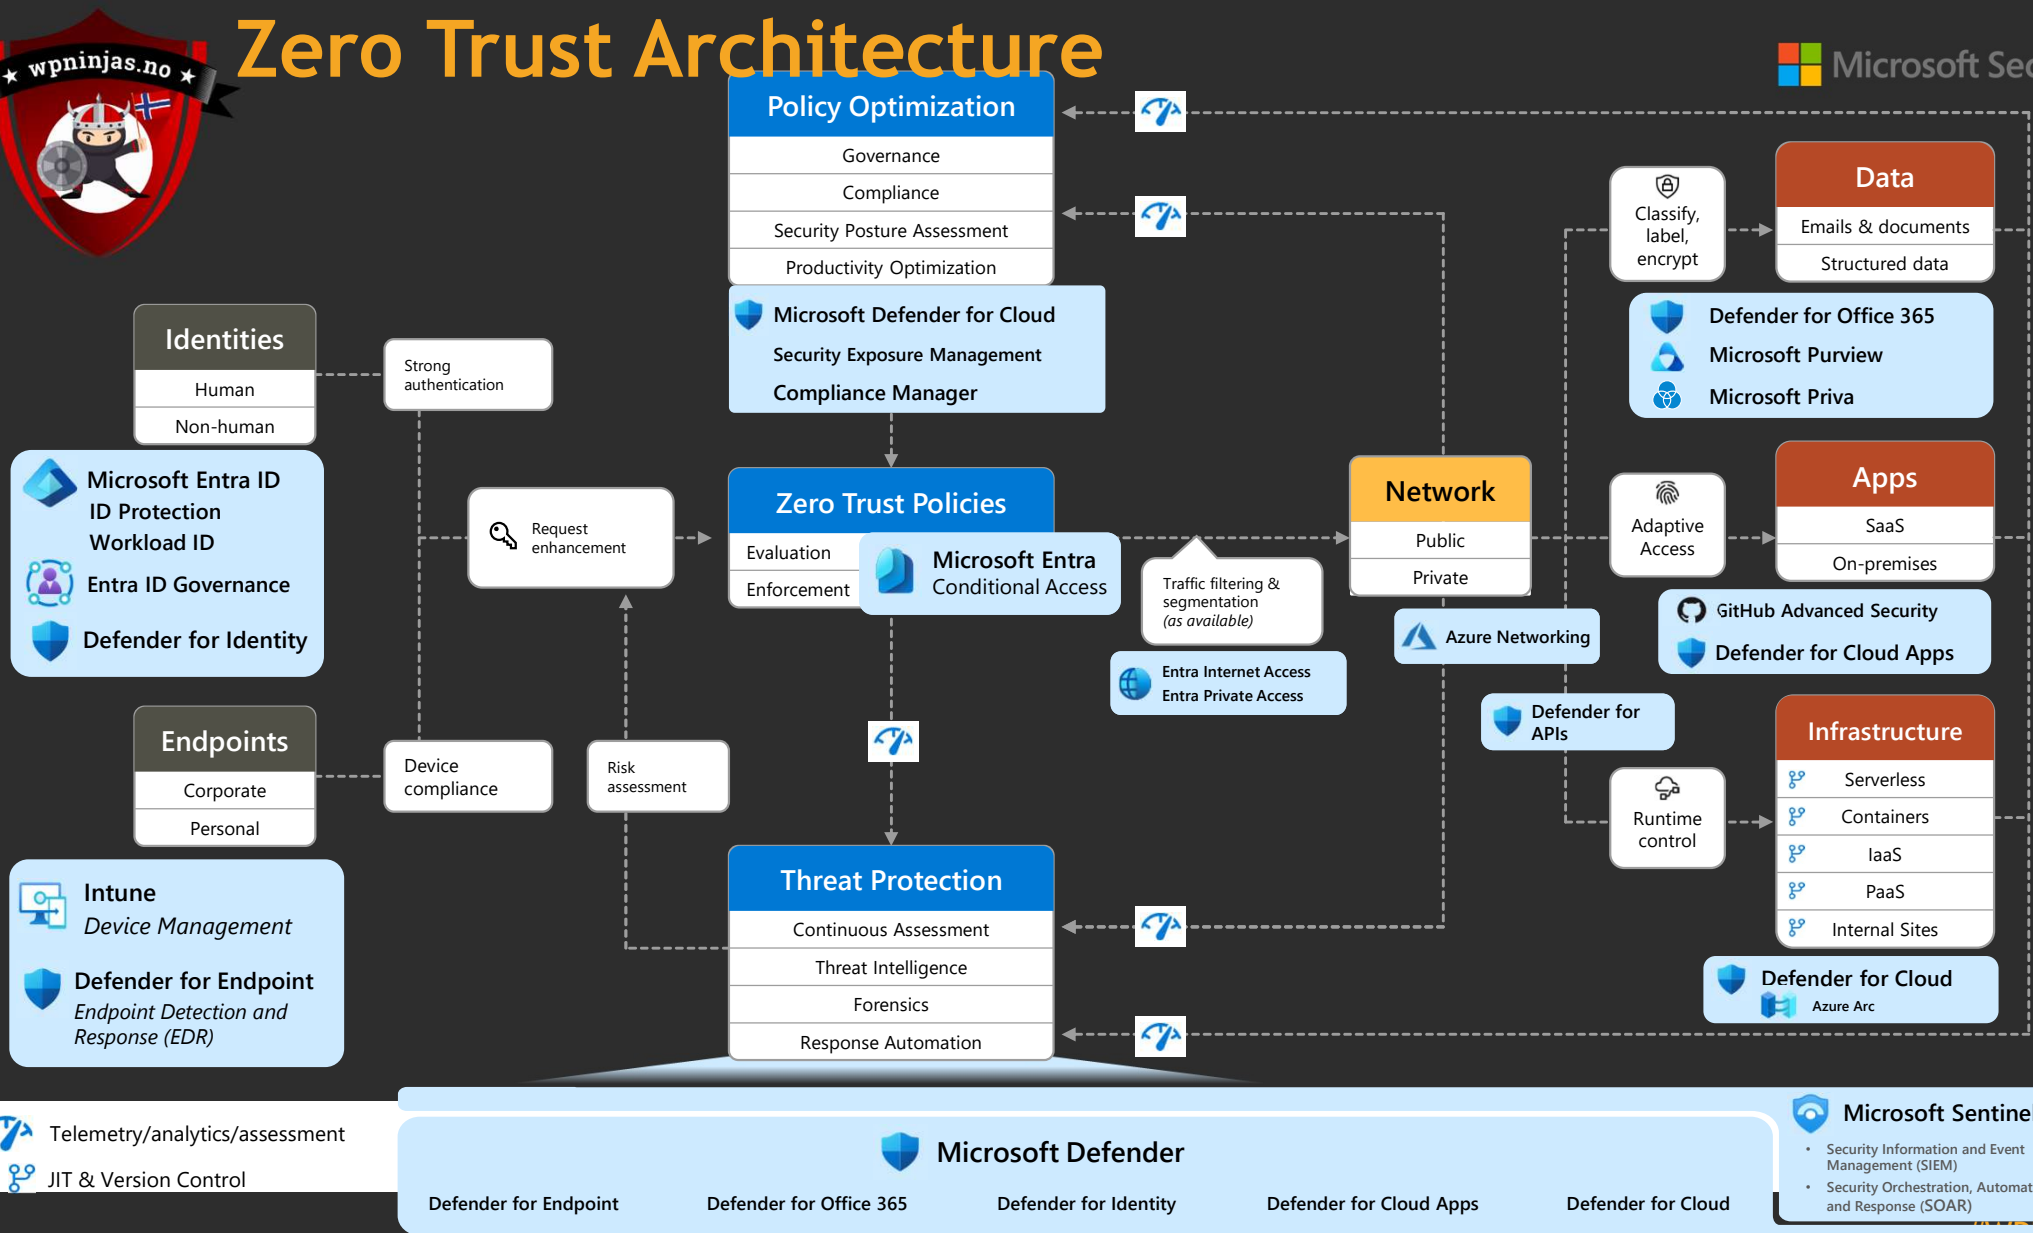

Legacy network security stacks are no longer sufficient

- 1 Dramatic traffic increase strains network capacity and on-prem security stack. Sub-optimal user experience on account of traffic hair-pinning.
- 2 Users circumvent IT controls and access resources directly.
- 3 Compromised users/devices can move laterally on traditional corporate networks.
- 4 Classic VPN produces little meaningful telemetry. Who connected, to what, from which device health state?

Zero Trust Architecture

Microsoft Security

M365 Traffic visibility
and Compliant
network check

Entra Internet Access: Killing the Token Theft Attack

M365/Internet Access

User authenticates
to M365

AiTM proxy
steals session token

Attacker replays token
from external IP

✗ M365 accepts token
(no network check)

WITHOUT GSA — Classic AiTM Attack Succeeds

User authenticates
through GSA client

M365 receives request
with source IP tag

CA: Compliant Network
Check enforced

✓ Token bound to
GSA network — replay
blocked

WITH GSA — Compliant Network Check Binds Token to GSA PoP

How to Enable Compliant Network Check (3 Steps)

- ① Entra Portal → Global Secure Access → Session Management → Enable 'Microsoft traffic' profile
- ② Conditional Access Policy → Conditions → Networks → Include 'All compliant network locations'
- ③ Deploy GSA client via Intune to all managed devices — traffic acquisition starts automatically

Journey to SSE - Decision to move

Traditional VPN

Microsoft Entra Suite

Complex, requires
networking experts to
configure and maintain

Maintenance

Simple to configure and
maintain with basic networking
knowledge and Entra experience

Not designed for Zero Trust and
challenging to implement

Zero Trust

Architected from the ground
up for Zero Trust

Minimal native security
features for authentication

Security

Native to Entra, secured by
Conditional Access and Entra SSO

Conditional Access

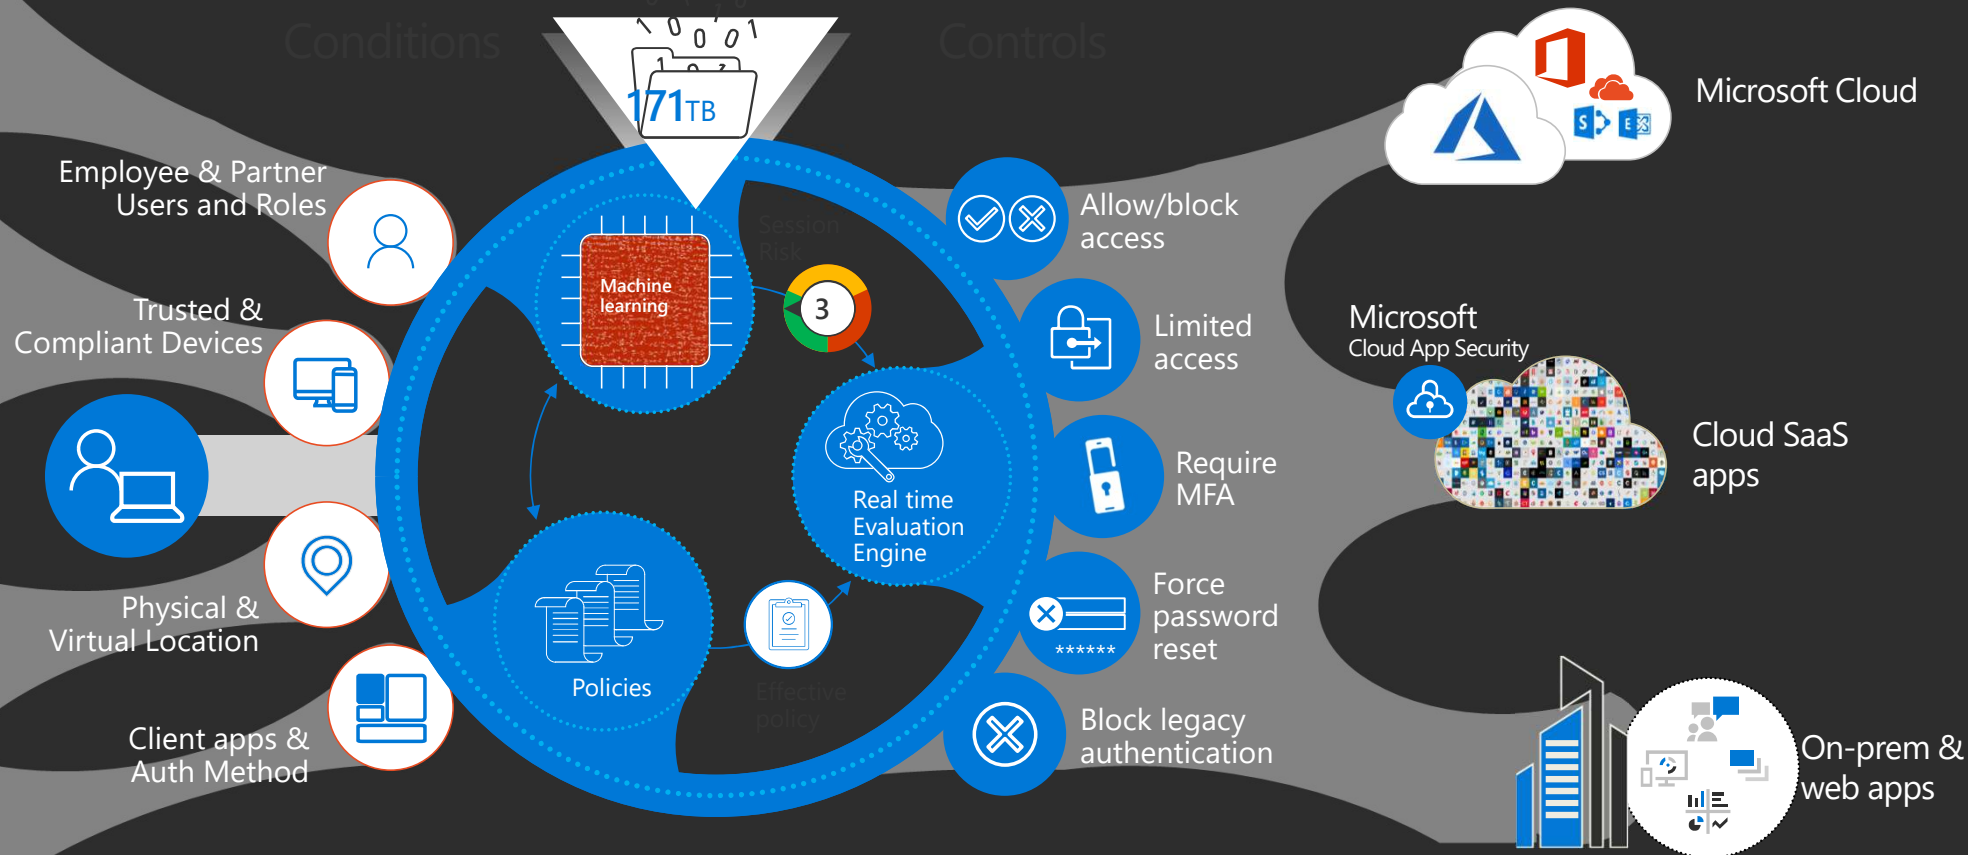

- Entra ID
- ADFS
- MSA
- Google ID

- Android
- iOS
- MacOS
- Windows
- Windows Defender ATP

- Geo-location
- Corporate Network

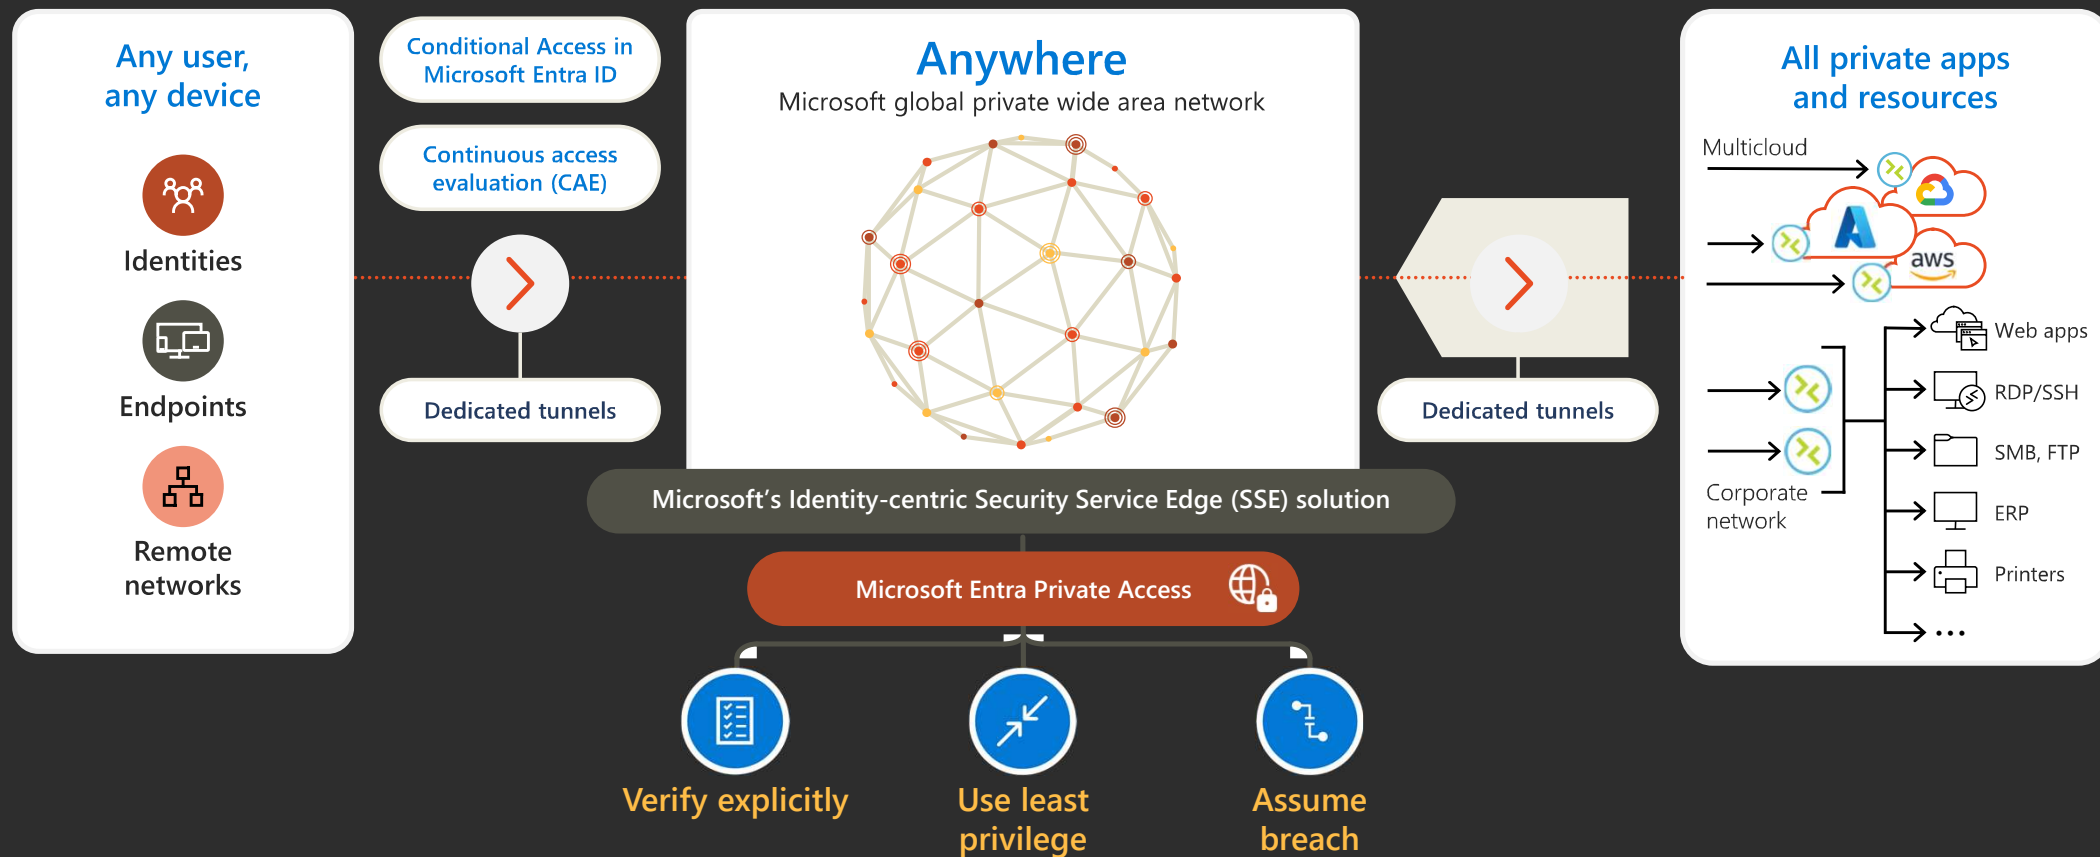

- Browser apps
- Client apps

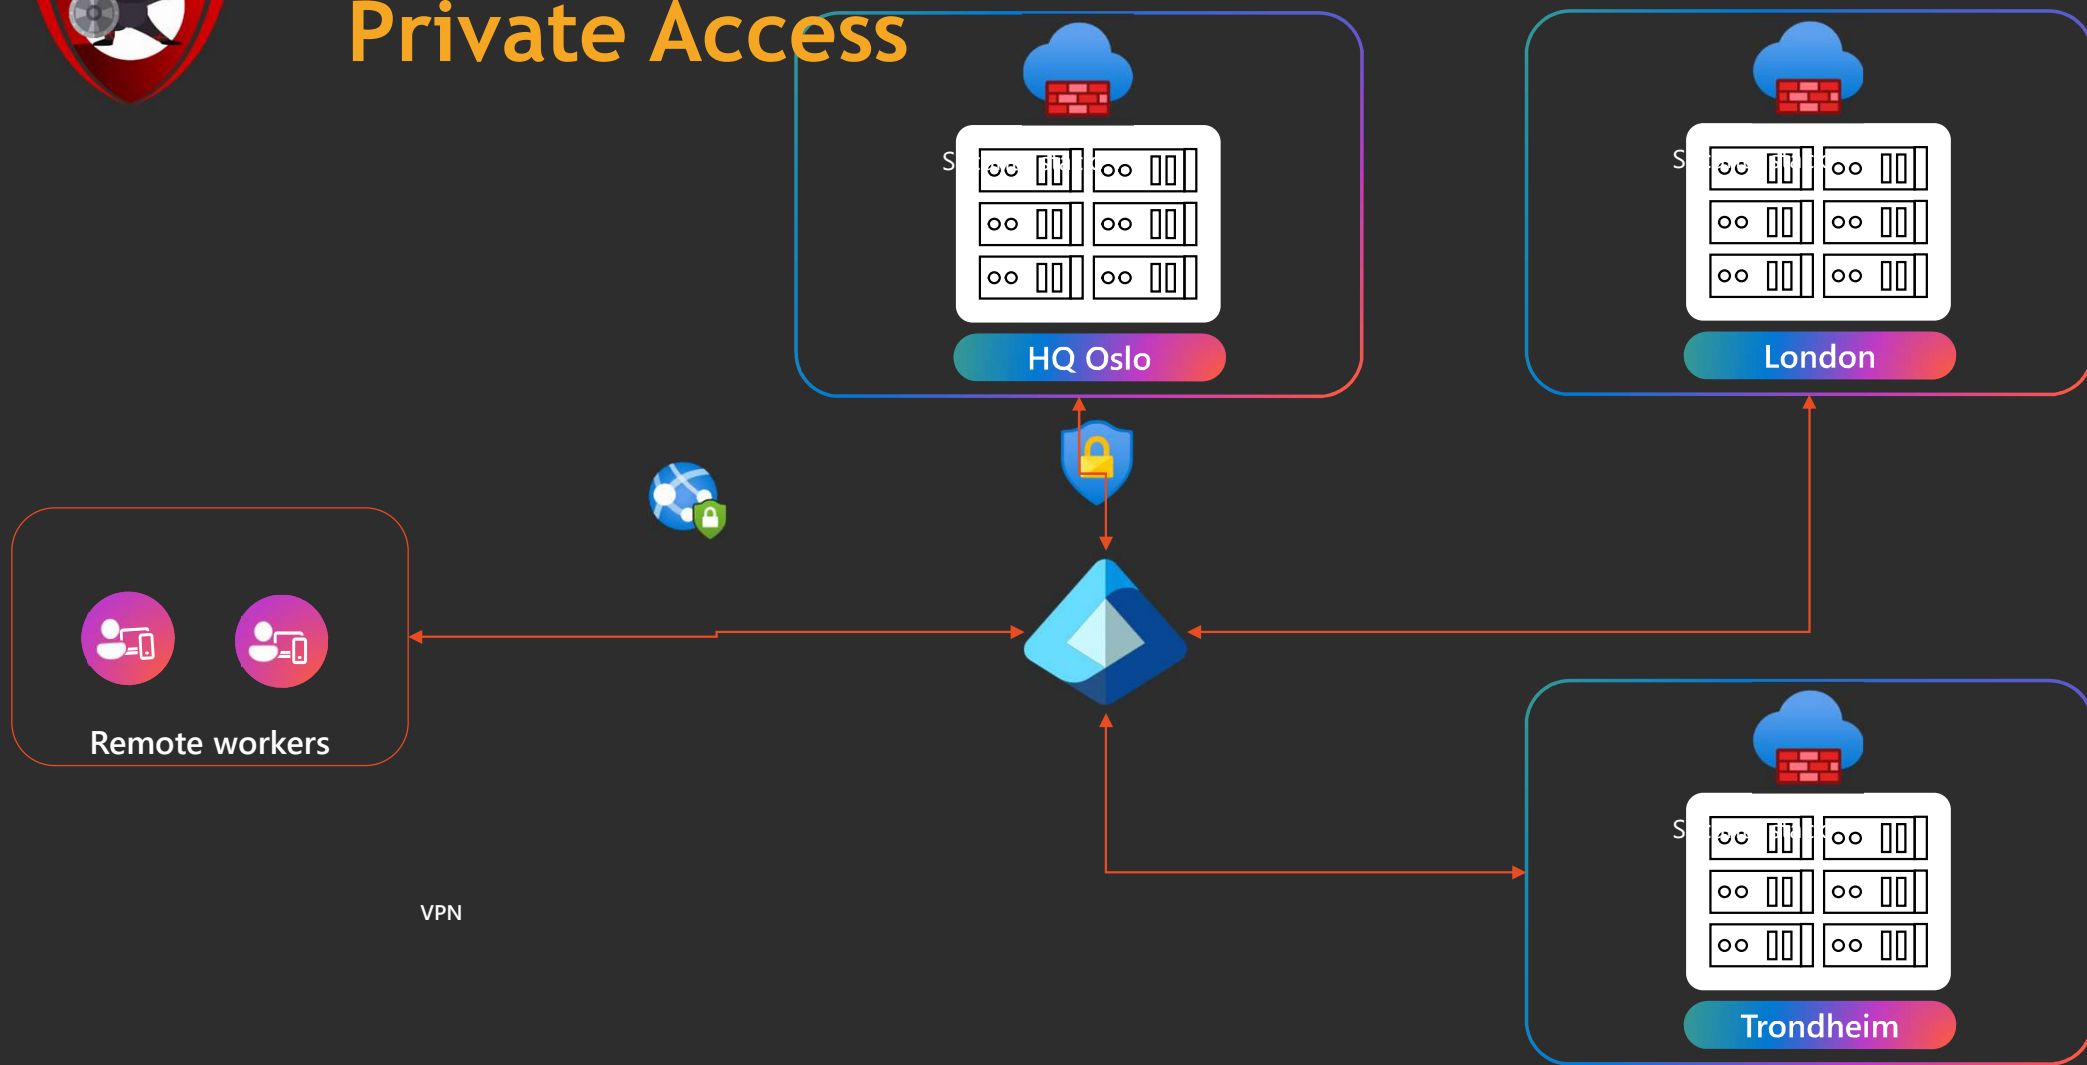

Entra Private Access

An identity-centric Zero Trust Network Access

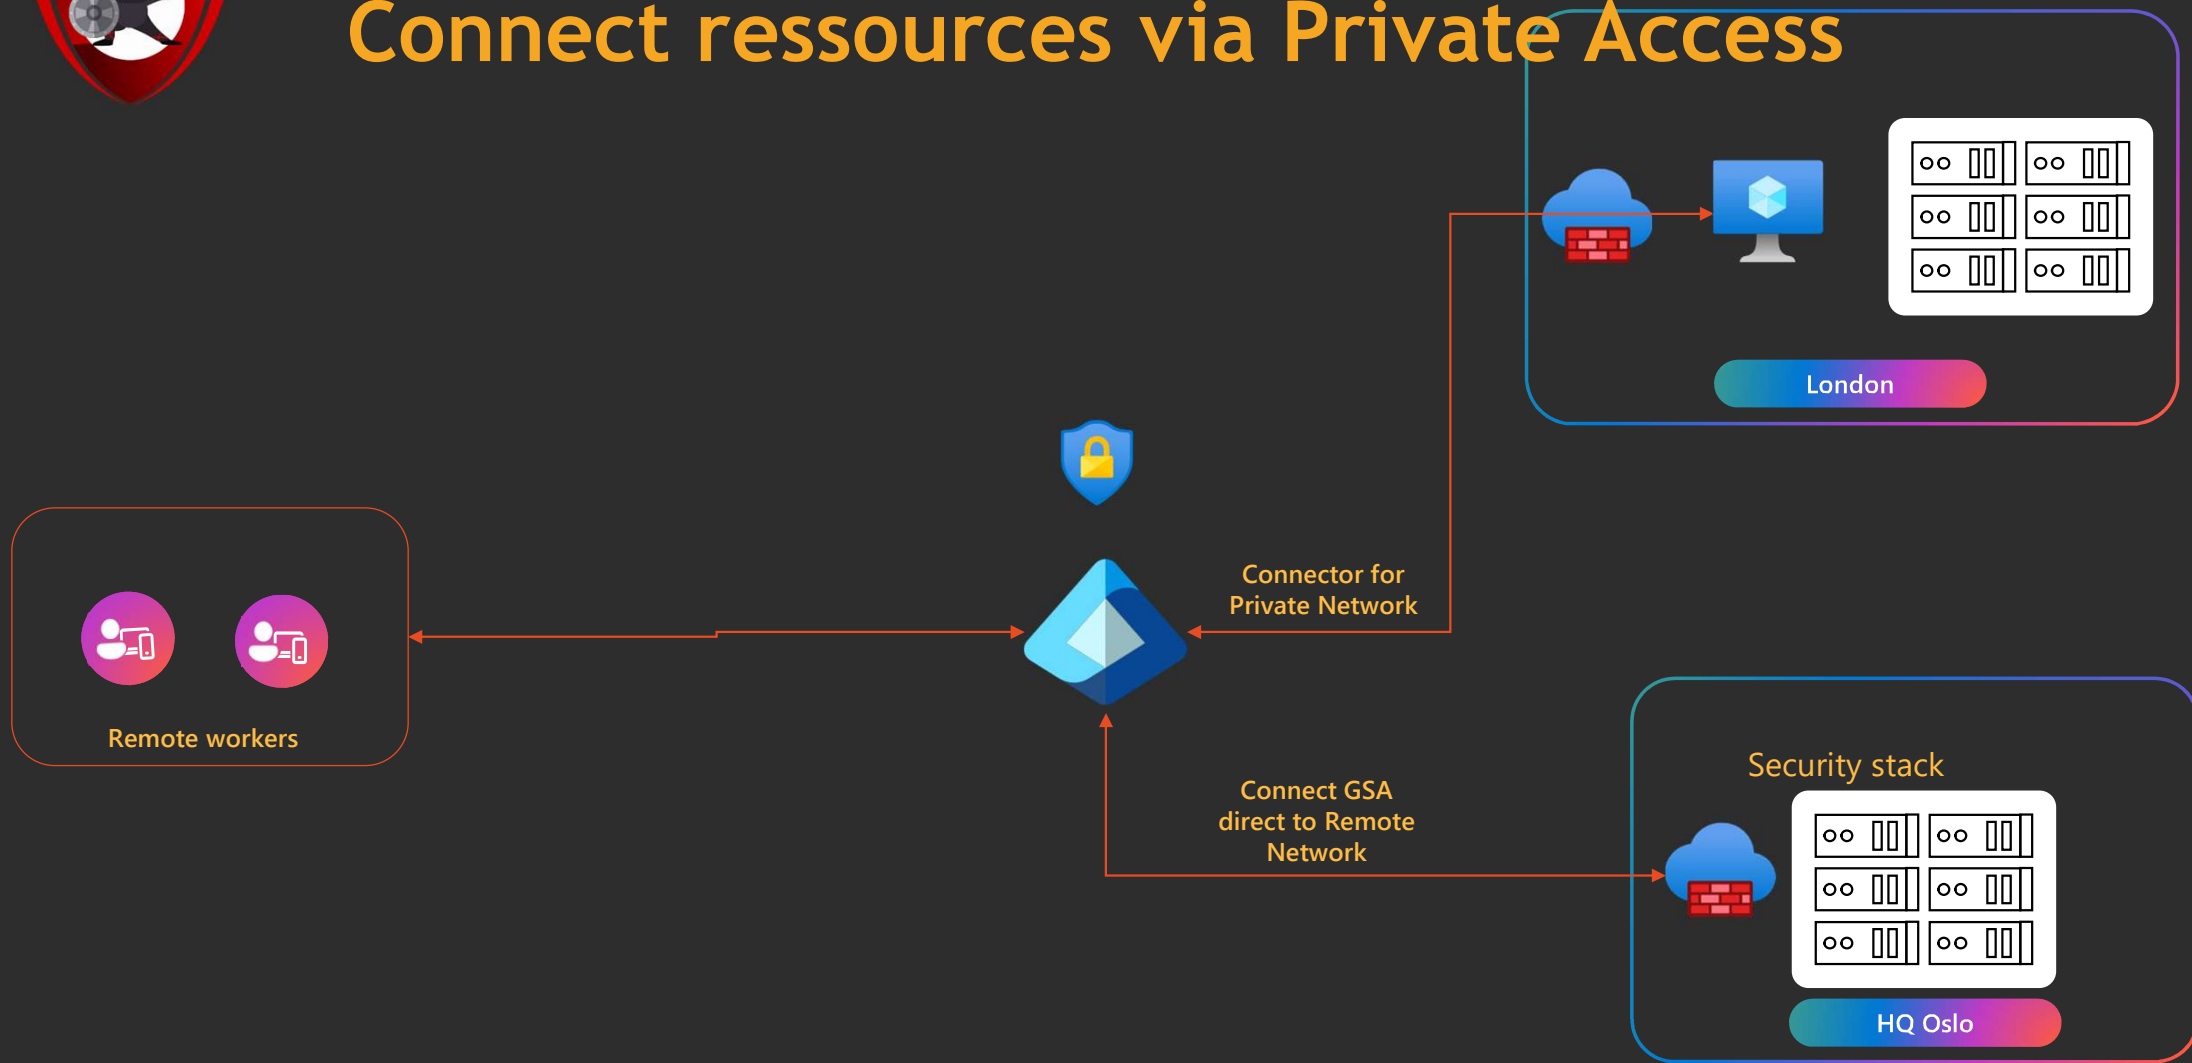

Private Access

Connect resources via Private Access

#WPNinjasNO

Private Network Connector

Lightweight agents on a Windows server inside the network

Create connections to Entra

Needs open 80 and 443 to Entra

Minimum of one connector needed

2 recommended for Highavailability

Connectors can add and remove any time

Get automatic updates

Demo

Entra Private Access

- Connector Setup
- App access without VPN

VPN vs. Entra Private Access: Side by Side

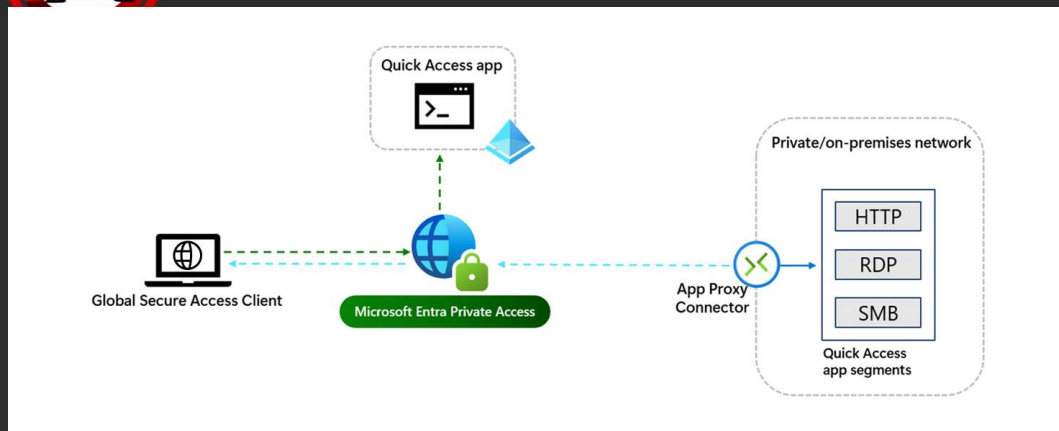

Private Access

Modul	Classic VPN	Entra Private Access
Network Access Model	Full network segment access	Per-app / per-resource only
Inbound Firewall Rules	Required (open ports to concentrator)	None — outbound connector only
Identity & Device Check	Certificate or PSK at tunnel time	Conditional Access on every request
Token / Session Security	No token binding	Compliant Network Check (CAE)
Latency (on-prem users)	Backhaul to DC then resource	ILA: direct to resource on trusted network
Visibility & Telemetry	Firewall logs only	Per-user, per-app, per-session in Entra logs
Legacy App Support	Full (network-level)	Kerberos/NTLM + DNS suffix routing
Mobile / BYOD	Separate MDM VPN profile	Same GSA client, MAU licensing for guests

#WPNinjasNO

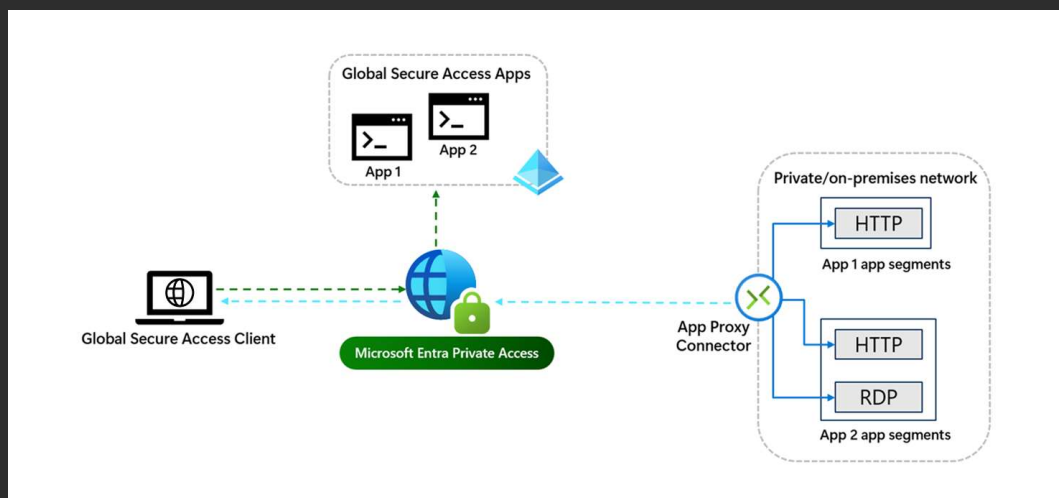

Quick Access app

- primary group of FQDNs and IP addresses that should be always available
- Like as baseline for GSA connectivity

Global Secure Access app

- when different CA Policies are required
- for connectivity for a subset of users

Conditional Access

- Use additional CA-Policies for GSA
- Think on a naming concept for CA- and GSA policies
- Create additional CA-Policy like for AVD, Fileshare, etc.
- Think on Network conditions for GSA
- If you have Tiering enable strength auth for accessing

GSA Rollout/Migration Path

Deploy GSA agent
on Devices (Intune)

Enable Microsoft
365
traffic routing

Define Conditional
Policies for GSA

Phase 1

Phase 2

Run side by side or
Replace existing
VPNs with
Private Access

Check Defender for
Cloud Apps for
relevant SaaS apps

Enable Internet
access for relevant
SaaS apps

Phase 3

⚠ Common Migration Pitfalls

UDP-heavy apps (VoIP, RDP with UDP) still need special handling · NetBIOS / broadcast-based discovery needs DNS suffix config · Split-DNS for private.domain.com must be published via connector · Pilot with ITadmins before broad rollout

#WPNinjasNO

Pricing

\$12 PUPM
Microsoft Entra Suite pricing

Microsoft Entra Suite

- Private Access
- Internet Access
- ID Governance
- ID Protection
- Verified ID Premium

45% suite discount

30 day free Trial is available per Service

\$22 PUPM Value of components

- 1. Private Access \$5 pupm
- 2. Internet Access \$5 pupm
- 3. ID Governance¹ \$7 pupm
- 4. ID Protection² \$3 pupm
- 5. Verified ID³ Premium \$2 pupm

Microsoft Entra ID Plan 1 is a technical and licensing pre-requisite⁴

Notes: (1) Also available for Microsoft Entra ID P2 / ME5 / E5 Security customers at a discounted price; (2) Available as part of Microsoft Entra ID P2; (3) Standalone offer prices may vary; (4) Any offer that includes Microsoft Entra ID P1 (e.g., M365 E3) will also fulfill the pre-requisite requirement

GSA in 2026 - What's new

- Network content filtering by file type in Global Secure Access
- Prompt injection protection
- Global Secure Access client on iOS and iPadOS
- Configure Global Secure Access with Cloud Firewall and remote networks for internet access
- External user access in the Global Secure Access Windows client
- Secure branch office Microsoft Entra Internet Access with Global Secure Access remote network connectivity
- Explicit Forward Proxy for Microsoft Entra Internet Access (Public Preview)

[What's New in Microsoft Entra: May 2026](#)

#WPNinjasNO

Homework

1. Enable the M365 Traffic Profile

1. Global Secure Access → Profiles → Enable Microsoft 365 profile. Takes 5 minutes. Zero user impact. Gives you instant visibility into M365 traffic and a clear baseline for Compliant Network Check rollout.

2. Run a Conditional Access What-If simulation

1. Entra Portal → Conditional Access → What If. Test your future 'Require compliant network' policy against your pilot users before enabling it. Catch gaps before they cause lockouts.

3. Install one Private Network Connector

1. Download from Entra Portal → GSA → Connect → Connectors. Install on any Windows Server with outbound HTTPS. No firewall changes. Create a Quick Access app for an internal tool and test in 15 minutes.
